

# Project Summary!

## Independent T-test:

- Males were more likely to believe in COVID Myths than females.

## One-way Anova:

- Republicans believe in myths the most, the Independent and no affiliation were in the middle and Democrats the least.

## Chi-Square:

- Republicans have the lowest number of vaccinated members and democrats have the highest.

## Correlation:

- Vaccine myths and COVID myths are probably related to restriction support. As the scores of both increase, restriction support decreases. Social concern is also probably related to restriction support, however as social concern increases so does restriction support.

## Regression:

- Having a higher social concern and a lower belief in the COVID and Vaccine Myths predicts an increase in restriction support.
