

Knowledge Category 9: behavioral genetics and epigenetics

Each talk (not person) is allotted 5 minutes

For each of the following, give a *very brief* description of the condition. Then, identify which genetic/epigenetic factors are known or suspected to either cause or increase the likelihood of getting the condition. If available, share information on concordance rates and likelihood of passing the condition down to children. Do NOT go into the nitty gritty details – keep it basic! Also, avoid the rabbit holes!

Autism

ADHD

Major Depression

Bipolar

Schizophrenia

Dementia
